Fax +44(0) 1344.706.242
Email: emea@marathontechnologies.com
Web: www.marathontechnologies.com

everRun SplitSite® delivers true disaster resilience by maintaining application availability between systems located in different, independent sites.

everRun SplitSite extends the core capabilities of the everRun software to support geographic separation with synchronization links routed over a switched WAN. Sites can be split between data centers in different locations, at varying degrees of geographic separation.

If disaster strikes one data center, applications and data are available, up-to-date and fully operational at the other location. And you don't need IT staff on-hand at the second location.

ACHIEVE TRUE DISASTER RESILIENCE

Pharmaceutical manufacturers, emergency response centers, broadcast media, utilities, energy companies and healthcare organizations all use everRun SplitSite to keep essential applications operational even during major, site-wide disasters.

Locating servers in different buildings or data centers protects your business from localized power failures and building-wide problems. Separating them geographically protects your business from major downtime due to major problems like hurricanes, flooding and earthquakes.

REMAIN COMPLIANT

In regulated industries, a site-wide problem can lead to data loss leads that risks compliance, adding significantly to the cost of the downtime.

That's why businesses in regulated industries like pharmaceutical manufacturing and financial services use everRun SplitSite to ensure that all data is safely replicated and remains available at all times, even during major disasters.

DEBUNK DISASTER RECOVERY MYTHS

Many businesses don't have adequate disaster recovery plans because they believe the following:

1. Disaster recovery is for disasters, not minor disruptions
2. Disaster recovery almost always involves downtime, data loss and IT intervention
3. Disaster recovery plans are a high-cost solution for preventing minor disruptions
4. Tape vaulting offers no application protection and always results in some data loss
5. Data replication technologies can't guarantee data integrity as transactions are often lost when failure occurs

While this may have been true once, everRun and everRun SplitSite change everything. everRun SplitSite eliminates the cost and chaos associated with typical reactive disaster recovery products.
